

Dear Sir,

I am a 3rd year mechanical engineering student at Cukurova University in Turkey. I am also a 3rd year double major student in industrial engineering.

My academic performance has been always on %1 of class. My grade point average is 3.44 of 4 in mechanical engineering department. Now, I am first order in my major class. Last year, I did my first summer course in a factory that works at design and product of molds in Turkey. This year, I want to do my summer course in European Countries. Erasmus program encourages students for summer courses for three months in EU. EU organizes and finances Erasmus program.

I think, new experiment in abroad is big opportunity for a good start to my engineering career. I aim to improve especially my experience, knowledge and skills for this training course in EU. Also a different country provides to learn about its culture, meet people from different cultures. Culture sharing with them is very beneficial experience. Also this experiment provides to improve my language. All of these experiments contribute the development of my vision. Also I can observe how both engineering (academically) and economic issues are handled. So I can say that no education is complete without experience.

Germany, is the best in mechanical engineering, is my first choice as a foreign country. So this summer I want to be, if possible, in Germany.

I believe my educational background would enable me to make an adequate contribution in the company. I expect I can learn a lot from this experiment.

I thank you for your time and look forward to hearing from you.

Yours sincerely,

Muhammed Murat AKSOY
